## Part A: URL of the Visualisation

*Paste your visualisation URL in the empty space below.*
*Tip: Test your URL in incognito mode to ensure it is a working URL*

https://public.tableau.com/views/DataVisualization1-TrafficCongestioninKL/VizDraft?:language=en-US&:sid=&:redirect=auth&:display_count=n&:origin=viz_share_link

## Part B: Domain Description

**Describe your *domain* chosen for DV1**
The domain for this visualization project is **urban transportation and traffic congestion in the Klang Valley**. It focuses on how the usage of different types of transportation impacts the traffic congestion within the surrounding areas.

**Describe the "Why" and "Who" aspects of your DV1**
This visualization is intended for **urban planners**, **policymakers**, **transport authorities**, and the **general public** who are interested in understanding transportation patterns and congestion issues in Klang Valley. Commuters would also like to understand why congestion delays have been increasing lately since many employees work in the region. It also aims to explore whether increasing public transport usage has reduced reliance on private vehicles and improved congestion conditions in the region.

**Describe the "What" aspect of your DV1**
This dashboard visualizes **public transport ridership trends**, **traffic congestion patterns**, and **vehicle registration data** over time. It compares different transport modes to identify patterns in transportation usage and their potential relationship with congestion levels. The charts highlight changes before and after the COVID-19 pandemic and examine how transportation behaviour has evolved in recent years.

**Describe the "How" aspect of your DV1**

The analysis was conducted by combining multiple datasets related to **public transport ridership**, **traffic congestion indicators**, and **vehicle registrations**. I've also wrangled the datasets to ensure that I'm able to create the desired visualization charts for my dashboard. Various visualizations were used to reveal patterns and relationships between different transportation usage and congestion over time.

Traffic Congestion and Public Transport Accessability in Klang Valley
A visual analysis of how public transport usage and private vehicle ownership impacts traffic congestion in areas around the region
Transportation Usage Over Time
Rail ridership dropped sharply during the COVID-19 pandemic before recovering after 2022.
MRT Kajang 53M
LRT Kelana Jaya 90M
LRT Ampang 71M
MRT Putrajaya 56M
KL Monorail 21M
KTM Komuter 10M
High ridership on LRT Kelana Jaya and MRT Kajang likely reflects convenient routes and accessible stations.
Rapid vehicle registrations indicate increasing private vehicle dependence, which may contribute to higher congestion levels.
Recovery and Growth System
Ridership levels rebounded sharply after 2022 as public mobility recovered from pandemic restrictions
2019 Baseline
168.3% KL Monorail
145.0% MRT Kajang
100.0% LRT Ampang
94.7% LRT Kelana Jaya
Fast-paced, modern railway systems are experiencing huge growth rates from 2024 to 2025
Line length represents absolute ridership change, while labels show percentage growth.
Annual Ridership (Millions)
Traffic Congestion Patterns
Weekly vs 4-week Moving Average
The 4-week moving average smooths short-term fluctuations and highlights the underlying congestion trend.
Average Delay (Minutes)
No Delay
Despite occasional drops in congestion levels, congestion remains a recurring issue as total traffic length periodically soars.
Most days have an above average jam count, indicating that traffic congestion is everywhere
Average Jams Count
Relationship Analysis
Congestion Levels Reaching New Heights
Average Congestion Level
Higher Congestion Levels Lead to Longer Travel Delays
Average Traffic Index Live
Klang Valley Regions Dominate Vehicle Registrations
Car vs Bus vs Train
Public transport use is rising, yet car ownership continues to increase, suggesting persistent dependence on private vehicles.
Summary
• COVID-19 caused a temporary decline in public transport ridership.
• Public transport usage has since recovered strongly.
• Private vehicle ownership continues to increase each year.
• Growing dependence on private vehicles contributes to traffic congestion despite improvements in public transport.
